

Siddhaarth B S

siddhaarth09@gmail.com +91 7892926651 github.com/siddhaarthaa LinkedIn

Summary

Computer Science student focused on backend and software development, with experience building APIs, Linux-based systems, Dockerized AI evaluation environments, and open-source software. Skilled in Go, TypeScript, Node.js, PostgreSQL, Docker, AWS, and CI/CD workflows, with strong interest in backend engineering, distributed systems, observability, and database consistency.

Education

IIIT Dharwad Dharwad, Karnataka, India B.Tech in Computer Science	2023–2027
Ambika Vidyalaya Puttur, Karnataka, India Pre-University Education	2021–2023 Grade: 94%

Achievements

- Secured under 3,000 rank in KCET and COMEDK; scored 96 percentile in JEE Main.
- Solved 500+ data structures and algorithms problems across coding platforms.

Experience

Shipd AI, Datacurve	<i>AI Evaluation Engineer, Team Terminus Contract Contributor</i>	Mar 2026 – Present
- Built 5 accepted Project Terminus evaluation environments for software-engineering agents, packaging each task as a prompt, <code>environment.zip</code>, and <code>verifier.zip</code>. - Authored Docker-based environment bundles from broken repositories, ensuring the root <code>Dockerfile</code>, build context, and runtime files reproduced the intended debugging scenario. - Wrote task prompts, setup guidance, and expected success conditions so agent-facing requirements matched the real behavior validated by the hidden verifier. - Developed isolated verifier workflows with root <code>verifier.sh</code> scripts and helper checks that failed on untouched environments and passed only after a correct fix. - Designed selective-difficulty tasks with deterministic validation; one environment was solved in only 1 of 11 agent attempts.		
Tiled Map Editor	<i>Open Source Contributor, C++ and Qt View Pull Requests</i>	Jan 2026 – Apr 2026
- Authored 8 pull requests, including 5 merged changes, in a large C++ and Qt desktop codebase. - Fixed multi-instance snapping consistency by migrating separate snapping flags to a shared <code>SnapMode</code> enum and synchronizing menu state with persisted settings. - Fixed runtime translation gaps by updating <code>LanguageChange</code> handling across editor widgets, models, action handlers, and dynamic property labels. - Fixed export filename generation when export filters were unset and aligned <code>tileset</code> export filter preference reuse. - Added <code>tileset</code> tab-title fallback behavior so unnamed <code>tilesets</code> display a filename instead of an empty tab title. - Developed contiguous selection and fill behavior for Magic Wand and Bucket Fill tools, including an Alt-based temporary toggle and cleanup of Select Same Tile references.		
Freelance Video Editor	<i>Video Editing, VFX, Motion Graphics Global Client Work</i>	2023 – 2025
- Delivered 50+ professional video editing, VFX, and motion graphics projects for 25+ international clients. - Maintained a 5-star Fiverr rating by managing client requirements, revisions, deadlines, and final delivery quality.		

Projects

eBPF Sentinel

GitHub

- Go and eBPF observability agent attaching kernel probes to accept, connect, exec, read, and write.
- Reconstructed L7 HTTP request-response flows from ring-buffer events by correlating pid+fd state with TTL-based eviction.
- Implemented profile-driven anomaly detection for unknown processes, unauthorized egress CIDRs and ports, privileged-port access, and exec policy violations.
- Added container and Kubernetes metadata enrichment using /proc/cgroup parsing and pod resolution, then exported spans and metrics via OTLP and Prometheus.

OpenLedger — Digital Wallet Platform

GitHub

- Built a wallet platform backend using Express, Prisma, and PostgreSQL in a monorepo architecture.
- Engineered async deposit flows with mock bank integration, redirect approval, and webhooks.
- Designed idempotent settlement logic and atomic balance guards to prevent duplicate credits and race-condition overdrafts.
- Developed authentication via Google OAuth and email-password login with bcrypt and HttpOnly cookies.

Homelab — Self-Hosted File Manager

GitHub

- Built a self-hosted file manager using React, Node.js, and Express for managing files on local storage.
- Developed APIs for directory listing, uploads, rename-delete actions, metadata retrieval, and ZIP downloads.
- Implemented storage quota tracking, list-grid UI, breadcrumb navigation, and filesystem safety checks.

Skills

Languages: C++, TypeScript, JavaScript, Go, SQL, C

Backend and Systems: Node.js, Express, REST APIs, JWT, OAuth, Prisma ORM, eBPF, Linux internals

Databases: PostgreSQL, MongoDB

Cloud and DevOps: AWS (EC2, RDS, S3), Docker, Kubernetes, Linux, Nginx, Cloudflare

Observability: Prometheus, OpenTelemetry (OTLP), Jaeger

Tools: Git, GitHub Actions, Postman
